	Urgent	Not urgent
Important	Do - (Your MVP) - Read a text file using java, searching for specific words or phrases provided by the user - Displaying whether the words or phrases were found in the text file - Being able to handle basic errors, like missing file or empty search term, without making the program crash	- Displaying the lines containing the search term, so that user only needs to read relevant portions of a text - Support case-insensitive reading. This way capitalization won't impact results - Allow the user to search multiple words or phrases
Not Important	Delegate - (Use a library) - Use java's Scanner class to be able to read user input in terminal - Use java's in-built file handling classes like BufferedReader - Use java's in built exception handling methods	Delete - Cut it - Automatically get contents of a web page through internet links - Generating a relevance score or rankings for a bunch of documents - Being able to identify whether the text answers the exact question the user is looking for - Identify whether a topic is discussed in depth - Being able to search for the different forms of a word, like run, ran and running
